

□ Mixture :

■ *Mix with soil before seedlings :*

8 to 10 liters/m² of ORGANISOL onto the top 5cm of the soil with the last stamping before seedlings.

■ *Mix with the seed for direct seedlings :*

Observe the following proportions for 1m² : mix 15 to 25 grams of seeds (depending on the type of mixture) with 5 liters of ORGANISOL and spread it directly on the soil.

■ *Spread on turf :*

3 to 7 liters / m² of ORGANISOL depending on the maintenance technique. Spread regularly on the soil, even the surface with the back of a rake and brush the turf to make sure the mixture penetrates the soil and the stems of the grass.

□ Recommendations to regenerate your turf :

- 1 Remove moss and other weeds.
- 2 Mow the lawn as low as possible.
- 3 Dethatch or aerate the soil in order to loosen the top.
- 4 Remove all the waste.
- 5 Apply 4 to 5 liters / m² of ORGANISOL and spread it with the back of a rake. ORGANISOL can be used in every spreaders.
- 6 Sow the grass adapted to the environmental conditions (drought, shade ...) and use (ornamental, sport ...)
- 7 Roll the turf and keep an adapted moisture until the complete germination.

□ Properties :

- Provides an ideal climate to allow a smooth and rapid growth of the seedlings.
- Retains moisture, for a positive effect on growth.
- Limits the compaction of the surface.
- Loosens the soil and provides a better penetration of water and nutrients.
- Organic activator (100% organic) completes the performance by providing essential elements for the plant to grow.
